The tariff system shall ensure non-discrimination. We as users have no (or at least small) impact on how the system is fed. The stamp method ensures that no one is discriminated based on decisions about connections / supplies. A capacity-weighted distance method does not.

Swedegas NC TAR

The stamp method is used in electricity distribution and secures an fair and easy to understand model for cost splitting. It is reasonable that network tariffs are built according to the same principles for different energy carriers. It is also the dominating principle in the European distribution systems.

A large difference in distribution costs between regions affects the development of natural gas use and the industry's ability to compete. A less utilized natural gas network leads to higher costs per unit.

Best Regards
Lars
